INDIVIDUAL.  
INNOVATIVE.**

# cart-couture

We give customers the opportunity to contribute their ideas to product development. We support them in this process. Customers receive expert support from our team throughout the entire project.

## Brainstorming

Do you need support in the search for an ideal new product? ITD's skilled personnel develop our customer's precise product vision into a workable idea, from a personal and technical perspective.

## Personal advice

The next stage is to clarify what is needed to realise the idea. Our team presents cost-effective methods for realising the customer's requirements, after which a concept is developed together.

## Development and Design

ITD is happy to work with the customer's in-house designers on request. Alternatively, we provide solutions from a single source; we create, for example, 3-D models and renderings that the customer can compare with their own ideas.

## Prototype

The prototype created is the initial means of making the product idea tangible. As well as the visual aspect, the product's functionality and suitability for everyday use can be reviewed and optimised.

## Test phase

ITD conducts test procedures for the newly developed product regarding compliance with regulations and standards. This ensures and certifies quality requirements as well as product safety.

## Production

We assemble, pack and label the finished product. We also take account of all requirements when designing the packaging and labelling to ensure we provide a high-quality product.

## Reliable delivery

We are happy to arrange the dispatch and on-time delivery of the end product. Products are shipped using international carriers, ensuring the safe and sound delivery of goods.
